OVERVIEW

- Third-year Ph.D. Student and NSF Graduate Research Fellow in the Department of Physics at Yale University using numerical simulations of dark matter halo evolution to constrain the nature of dark matter.
- My research is statistical in nature, employing tools from machine learning (random forests and convolutional neural networks) and topology data analysis (persistent homology).
- Experienced with Python (four years) and distributed computing systems and familiar with C/C++ and parallel/GPU-computing.
- In the past year, I have lead-authored three scientific publications and co-authored an additional three; I am very capable of remaining productive while collaborating on several research projects simultaneously.
